MPEG systems technologies for advanced media synchronization

Youngkwon Lim
Chair, MPEG Systems
Samsung (young.L@samsung.com)
Basics of media synchronization in MPEG
Synchronization in MPEG-2 System (ISO/IEC 13818-1)

- Synchronization among multiple elementary streams is accomplished with Presentation Time Stamps (PTS), which is generally in units of 90 kHz.
- Synchronization of a decoding system with a channel is achieved through the use of the Program Clock Reference (PCR) which has resolution of 27 MHz.
- Each program in a Transport Stream, which may contain multiple programs, may have its own time base. The time bases of different programs within a Transport Stream may be different.
MPEG-2 TS Delivery of Timeline for External Data

Synchronization in MPEG-4 System (ISO/IEC 14496)

- “presentation time stamp” concept has been migrated to “composition time stamp”
- Multiple clock reference has been enabled by introduction of OCR (Object Clock Reference)
- Scene Description concept has been introduced by Part 11 BIFS (Binary Information For Scene)
Decoding Time to Sample Box (‘stts’)

- Each entry gives the number of consecutive samples with the same time delta, and the delta of those samples.

Composition Time to Sample Box (‘ctts’)

- This box provides the offset between decoding time and composition time.
- The composition time to sample table is optional and must only be present if DT and CT differ for any samples.

Edit List Box (‘elst’)

- This box contains an explicit timeline map.
- Each entry defines part of the track time-line: by mapping part of the media time-line, or by indicating ‘empty’ time, or by defining a ‘dwell’, where a single time-point in the media is held for a period.
Synchronization in DASH

- **Period@start**
  - if present, specifies the PeriodStart time of the Period.
  - The PeriodStart time is used as an anchor to determine the MPD start time of each Media Segment as well as to determine the presentation time of each access unit in the Media Presentation timeline.

- **SegmentBase@presentationTimeOffset**
  - specifies the presentation time offset of the Representation relative to the start of the Period.

- **MPD@availabilityStartTime**
  - the start time is the anchor for the MPD in wall-clock time (UTC) in live streaming
Synchronization in MPEG-H (ISO/IEC23008)

- Part 1 MMT
  - MPU_timestamp_descriptor: provides presentation time of the first AU of MPU in presentation order after application of any offset such as the one provided by ‘elst’ box.

- Part 11 MPEG Composition Information
  - Companion document to HTML5 providing complicated media synchronization in XML

More information
- Tutorials on MMT & MPEG CI will appear MPEG web site soon (mpeg.chiariglione.org)
- Demos of MMT implementations are available outside.
Exploration on Timeline Alignment in MPEG
Use Cases (1/2)

- Categorization factors of timeline alignment cases
  - Number of different contents
  - Type of the content e.g. audio, video, etc...
  - Format of the content
  - Number of devices playing-out at least one of the content
  - Physical locations of the devices
  - Physical networks the devices are connected to
  - The requirement on the synchronization accuracy (frame accurate or not)
## Use Cases (2/2)

Normal Play Time (NPT), as defined in section 3.6 RFC2326: a timestamp indicating the stream absolute position relative to the beginning of the presentation, in a lossless way.

Wallclock Time (WCT): absolute clock tick that can be associated with a media frame. This can be in the form of UTC clock, NTP timestamp or PTP timestamp.

Time Code (TC): another form of NPT with more details on the source, typically taking into account frame rates and drop-frames video formats.

Summary
Summary

- MPEG has defined standards to describe synchronized presentation of multimedia element streams by using a clock reference and time stamps.
- MPEG has also defined standards to describe spatio-temporal composition of multimedia objects which have number of independent clock references.
- Latest MPEG standards assumes environments with device clocks locked to UTC and HTML5 based presentation.
- MPEG is exploring a gap regarding advanced synchronization of numerous multimedia in hybrid environments involving multiple source, multiple delivery networks and multiple clients.
